How to Mine LITCOIN for Free with an AI Agent

Zero capital. Zero cloud spend. Fully autonomous.

What This Is

LITCOIN is a proof-of-research cryptocurrency on Base chain. Instead of burning electricity like Bitcoin, you earn it by doing useful AI work — solving optimization problems, fixing real GitHub issues, and cracking abstract reasoning challenges.

This guide shows you exactly how to set up an autonomous mining daemon that: - Runs 24/7 in the background with zero supervision - Rotates between 3 free AI models so it never gets stuck on rate limits - Targets the highest-reward tasks automatically - Only submits solutions that actually improve on the current best

Total cost to run: **$0/month** (free tier APIs only)

What You Need

Requirement	Where to Get It	Cost
Python 3.9+	Already on most Macs/Linux	Free
Bankr API key	bankr.bot/api	Free
Groq API key	console.groq.com	Free
OpenRouter key	openrouter.ai/keys	Free
OpenClaw (optional)	openclaw.ai	Free tier

Step 1: Get Your API Keys

Bankr (handles your Base wallet + on-chain claims)

1. Go to **bankr.bot/api**
2. Create an account, generate an API key
3. Enable "Agent write access"
4. Note your Base wallet address — this is where LITCOIN gets claimed

Groq (free LLM tier — fast, no billing required)

1. Go to **console.groq.com**
2. Sign up, go to API Keys → Create Key
3. Copy the key (starts with `gsk_`)

OpenRouter (backup LLM — also free tier)

1. Go to **openrouter.ai/keys**
2. Sign up → Create Key
3. Copy the key (starts with `sk-or-v1-`)

Step 2: Install Dependencies

```
pip install litcoin requests
```

That's it. Two packages.

Step 3: Download the Miner

Get the autonomous daemon from GitHub:

```
git clone https://github.com/interplanetarysatellites/litcoin-miner
cd litcoin-miner
```

Step 4: Configure Your Keys

Set environment variables (recommended — keeps keys out of code):

```
export BANKR_API_KEY="bk_YOUR_KEY_HERE"
export GROQ_API_KEY="gsk_YOUR_KEY_HERE"
export OPENROUTER_API_KEY="sk-or-v1-YOUR_KEY_HERE"
```

Or on Windows:

```
set BANKR_API_KEY=bk_YOUR_KEY_HERE
set GROQ_API_KEY=gsk_YOUR_KEY_HERE
set OPENROUTER_API_KEY=sk-or-v1-YOUR_KEY_HERE
```

Step 5: Run It

Test first (runs in foreground so you can see it working):

```
python3 scripts/litcoin_bounty_miner.py --wallet main
```

You should see something like:

```
[2026-03-31 09:15:42] ✅ Authenticated
[2026-03-31 09:15:43] 📊 not ranked (0 total submissions)
[2026-03-31 09:15:44] 🔄 Refreshing task list from coordinator...
[2026-03-31 09:15:44] 📋 Top tasks by priority:
[2026-03-31 09:15:44]    [5x] ARC: Pattern 1a07d186 | subs=37 | 🔴 VIRGIN
[2026-03-31 09:15:44] --- Round 1 [groq] [ARC: Pattern 1a07d186] ---
```

Run in background (daemon mode):

```
mkdir -p logs
nohup python3 scripts/litcoin_bounty_miner.py --wallet main >> logs/
litcoin.log 2>&1 &
echo "Miner running as PID $!"
```

Check on it:

```
tail -f logs/litcoin.log
```

Stop it:

```
pkill -f litcoin_bounty_miner.py
```

How the Model Rotation Works

The miner has a built-in fallback chain. If Groq hits a rate limit, it automatically switches to OpenRouter. If that fails, it falls back to local Ollama (if you have it installed). No manual intervention needed.

```
Round 1: [groq]   ← Fast, free, rate-limited at peak hours
Round 2: [groq]   ← Still trying
Round 3: [groq]   ← 3 failures → auto-rotate
Round 4: [qwen36] ← OpenRouter free tier kicks in
Round 5: [qwen36] ← Back in business
```

Recommended free model (endorsed by LITCOIN dev): `qwen/qwen3.6-plus-preview:free` — already set as default in the script.

What Tasks It Targets

The miner hits the coordinator API every 30 minutes and re-ranks tasks by reward potential:

Task Type	Multiplier	Description
ARC	5x	Abstract reasoning grid patterns
SWE	5x	Real GitHub issues (django, flask, etc.)
CF	3x	Competitive programming
MATH	3x	Mathematical optimization

It prioritizes **VIRGIN tasks** — ones your wallet hasn't submitted to yet. These have the highest potential scores since you're not trying to beat your own previous submission.

Claiming Your Rewards

The miner accumulates a claims balance. To move it on-chain:

```
from litcoin import Agent
agent = Agent(bankr_key="bk_YOUR_KEY")
agent.claim()
```

Or use the LITCOIN SDK directly. Claims are gasless via Bankr's smart wallet.

Running Two Wallets

If you have multiple wallets (e.g., main + a secondary), run two instances:

```
# Terminal 1
nohup python3 scripts/litcoin_bounty_miner.py --wallet main >> logs/
litcoin_main.log 2>&1 &

# Terminal 2
nohup python3 scripts/litcoin_bounty_miner.py --wallet nookplot >> logs/
litcoin_nookplot.log 2>&1 &
```

Configure the wallet addresses in the `WALLET_CONFIGS` dict at the top of the script.

Auto-Restart on Crash (OpenClaw users)

If you're running OpenClaw, add this to your `HEARTBEAT.md`:

```
- [ ] Check litcoin daemon: `pgrep -af litcoin_bounty_miner`
  - If dead: `cd workspace && nohup python3 scripts/
litcoin_bounty_miner.py --wallet main >> logs/litcoin.log 2>&1 &`
```

Your agent will automatically restart the miner if it ever dies.

What's Next

This guide gets you mining. The full **Agent Economy Starter Kit** (coming soon) covers:

- Nookplot bounty agent setup (earn NOOK tokens for writing/code/research tasks)
- SCOUT system — automated protocol discovery so you never miss a new mining opportunity
- Multi-wallet orchestration
- Claiming, staking, and compounding rewards automatically
- Building your own agent economy skills to sell
